Supplementary Fig. 1. (A) Seasonal distribution of estimated month of conception. Spring was the peak season analyzed by estimated conception month (27 patients, 33.3%). There was no significant difference between the seasons of the remaining data set. (B) Monthly distribution of estimated month of conception. Peak month of the Prader-Willi syndrome with deletion group, analyzed by estimated month of conception, was April (10 patients, 12.3%). October was the lowest month (3 patients, 3.7%). Deletion, microdeletion group; UPD, maternal uniparental disomy group.
